

Local Computation

Jesse Looney, Michael Allers, Paolo Canigiula, Henry LeCates

Summary

- **Last Time:**
 - We had a working “life” implementation
 - Planned to evolve rulesets for simple images
- **Currently:**
 - We have a custom Push implementation
 - Each individually used the Push and “life” implementation to evolve a simple pattern/image
- **Immediate Goals:**
 - Apply evolution to our four GAs and extract the “best” parts
 - Evolve persistent images

Project Goal

Investigate how self-repair emerges in evolved Push CAs.

All of existing literature focuses on self-repair in NCA or a tree based GP → How does the flexibility of Push (e.g., multiple data types, always valid syntax, etc) help (or hurt) the evolution of self-repair?
